01

Choose what to measure

Set the commercial goal, agree the questions and establish a useful baseline.

Start with the customer decision

Choose the conversations that matter to your business. Track brand mentions, recommendations and citations as separate measures.

Brand

Project owner

Commercial objective

What customer decision should your activity help influence?

Priority products or services

Audience and customer need

Country and language

Reporting dates

Complete Prompt Research first. Bring your selected questions into this framework, then agree how you will track them.

02

Select your prompt set

Complete one worksheet for each selected prompt. Keep the wording and ID consistent.

Prompt ID

Product or service

Exact customer prompt

Question type

Problem led, research, comparison or purchase

Audience or customer need

Customer evidence

Add a source reference, URL or research record ID.

Priority and reason

High, medium or low. Explain your choice.

Prompt group and date added

Core or exploratory. Record the date.

Keep the core set stable

Use the same core prompts for each reporting period. Give new or revised questions a new ID and track them separately as exploratory prompts.

Example: Which lightweight walking shoes are suitable for a city break under £100? This is an illustrative comparison question. Validate it against customer evidence before adding it to your core set.

03

Agree your tracking method

Use the same settings and repeat count each period. Save enough detail to repeat the work.

Platform and model or mode

Search settings

Country and language

Session method and repeats

Use fresh chats. Agree repeats per prompt.

Baseline period

Current reporting period

Review frequency and evidence location

Where will you save full answers, source panels and screenshots?

Code each answer consistently

Brand mentioned

Record Yes when the answer explicitly names the brand. A source link alone does not count as an answer mention.

Brand recommended

Record Yes when the answer recommends or selects the brand or product. A mention alone does not count.

Brand website cited

Record Yes when the answer or source panel links to the agreed brand website. Save the exact URL.

Use No for an absent result and Unknown when you cannot code it confidently. Record failed responses as Invalid. Keep missing information visible.

04

Record the answer

Complete one record per prompt, platform and repeat. Keep the full response with its sources.

Run ID and prompt ID

Date and time

Platform, model and settings

Country, language and repeat

Prompt group and reporting period

Core or exploratory. Baseline or current.

Response status

Valid or Invalid

Brand mentioned

Yes, No or Unknown

Brand recommended

Yes, No or Unknown

Brand website cited

Yes, No or Unknown

Exact source URLs

Full response or screenshot reference

Other brands and useful context

05

Explain the results

Report what changed, show the evidence and state what you will do next.

Compare one platform and prompt group at a time. Check that prompt IDs, wording, settings and repeat counts match across both periods.

Calculate each rate

Count valid runs coded Yes, then divide by valid runs coded Yes or No for that measure. Exclude Unknown and blank codes. Show the denominator beside every rate.

Baseline and current results

For each measure, record Yes count, coded runs and rate. Change equals current rate less baseline rate, expressed in percentage points.

What changed across the matched prompt set?

Which coverage was cited, and what else changed?

Include URLs and dates. Note product page updates, other campaigns or platform changes.

Conclusion and limits of the evidence

Explain what the results support and what remains uncertain. A citation shows source use. It does not establish revenue attribution.

Next action, owner and review date

For competitor share of voice, agree the competitor set and counting method first. One option is brand mentions divided by all tracked brand mentions in the same valid runs.
